# Deep Vein Thrombosis (DVT)

Formation of semisolid coagulum in a deep vein.

## Virchow's triad

- Abnormal surface (endothelial damage)
- Abnormal flow (stasis / turbulence)
- Abnormal blood (thrombophilia)

## Factors

- Immobility
  - Age
  - Obesity
  - Prolonged surgery
  - Pregnancy
  - Puerperium
  - Varicosity (effect of immobility, the rest are causes)
- Hormone-replacement therapy (high oestrogen)
- Previous DVT / PE
- Thrombophilia

## Common sites

- Popliteal vein
- Femoral "
- Iliac "

## Prevention

- Early mobilization
- Hydration
- Compression stockings
- Prophylactic LMW heparin
- Calf pumps
- Minimal use of tourniquets

## CABG

## Investigations for IHD

- ECG (first line)
- Cardiac enzymes (in acute coronary syndrome)
- Exercise tolerance test
- Echo: Evaluate
  - ventricular function

- regional wall motion abnormalities
- valvular lesions
- **Coronary angiography: gold std**
  - Extent, severity and location of stenoses
  - 70% reduction of diameter (i.e. >90% reduction of cross-sec) => severe

## Indications for surgery

- 50% stenosis of the left coronary artery (“*left main stem*”)
- 50% stenosis of the proximal *LAD*
- 2/3 main coronary arteries diseased (*RCA, LAD, LCx*)

## Graft selection

### Types

- **Venous:** long saphenous vein
- **Arterial:**
  - LIMA most common (left internal mammary / left internal thoracic artery)
  - Others
    - \* RIMA
    - \* Radial
    - \* Gastroepiploic
    - \* Inf epigastric

## Transfusion

### Indications

- Acute blood loss
- Periop anaemia
- Symptomatic chronic anaemia

## Complications

### Single transfusion

- Haemolysis (haemolytic transfusion reaction)
- Fever (febrile transfusion reaction)
- Allergic reaction
- Infections
  - Hep B, C
  - HIV
  - Malaria
  - Bacterial inf
- Air embolism
- Thrombophlebitis
- TRALI

## Massive transfusion

- Coagulopathy
- Hypothermia
- Hypo-Ca
- Hypo-K
- Hyper-K

## Clinical factoids

- Target Hb level: 10g/dL
- 1 unit transfusion = 1g/dL improvement

## Burns

### Mechanism of fluid loss

Intense inflammation in burnt areas → ↑ permeability → leakage of fluid into extravascular compartment

### Assessment

- Rule of 9:
  - First approx
  - Adult
    - \* Head-neck → 9%
    - \* Each upper limb → 9%
    - \* Torso front 18%
    - \* Torso back 18%
    - \* Each lower limb 18%
    - \* Perineum 1%
- Lund and Browder chart
  - More accurate
- For smaller burns, a piece of small paper about the size of the hand to measure the burnt area directly.  
Size of hand ≈ 1%.

## Fluid resuscitation

### Indications

- **If >10% TBSA in children or >15% TBSA in adults (B&L)**
- To correct hypovolaemia
- " " electrolyte imbalance
- To prevent shock
- To provide nutrition

## Important anticancer drugs

- **Mitosis interferers**
  1. Vincristine
  2. Vinblastine
  3. Taxanes (e.g. Paclitaxel)
- **Antimetabolites** (i.e. DNA synthesis inhibitors)
  1. Methotrexate
  2. 5-FU
- **DNA damagers**
  1. Platinum drugs
    - Cisplatin
    - Carboplatin
    - Oxaloplatin
  2. Cyclophosphamide
  3. Bleomycin
  4. Doxorubicin
  5. Etoposide
- **Hormones**
  1. Tamoxifen: ER blocker (Breast ca)
  2. Goserelin: GnRH analogue; downregulate ant. pituitary  $\rightarrow$   $\downarrow$  testosterone (Prostate ca)
  3. Flutamide: Androgen antagonist (Prostate ca)
  4. Bromocriptine: D2 agonist; blocks ant. pituitary stimulant (Pituitary tumour)
